

Third-Party Breaches: A Growing Threat to the Financial Sector

By: Timothy Williams

A staggering 97% of leading U.S. banks were affected by third-party data breaches in 2024. While specific data on the percentage of banks using third-party companies outside the country is unavailable, it's clear that a significant portion of the U.S. banking sector relies on external service providers for various operations.

- **Monitor External Attack Surfaces**
Execute automated scanning to uncover IT infrastructure and cybersecurity vulnerabilities throughout vendor and partner environments.
- **Identify Single Points of Failure**
Chart essential business processes and technologies to pinpoint any single points of failure. Compile a watch list featuring these vendors.
- **Automatically Detect New Vendors**
Passively observe vendors' IT deployments to pinpoint and address concealed supply chain vulnerabilities.

Research indicates that a significant number of data breaches in the finance sector occur via third-party companies, with 61% of organizations experiencing a third-party data breach in the previous year. These statistics highlight the considerable threat posed by third-party breaches to the financial sector, demanding strong risk management practices to reduce their consequences.
